

Script 3: Why your clips suck

Tentpole · Taste problem

2:00

FORMAT	Founder to camera, slight confrontation in delivery
USE FOR	POV post, audience education, brand positioning

[HOOK — 0:00-0:06] *To camera, direct, almost conspiratorial.* Your clips suck. And it's not your fault. Let me explain.

[CONTEXT — 0:06-0:30] *Slower, explanatory.* First-generation AI clipping tools trained on transcripts. Find the "most interesting sentence," slap it on a thumbnail, ship. Worked for five percent of clips. The other ninety-five percent felt like AI slop. Because they were. The problem isn't transcription. The problem is **taste**. *[B-ROLL: bad auto-clips with on-screen "🤖" stamps]*

[INSIGHT — 0:30-1:10] *Forward, articulate.* Taste is the thing that makes a creator go, "That moment — that's the one." It's the pause before the punchline. The face that flashes on camera for two seconds. The way someone's voice cracks when they say something they really mean. You can't measure taste with a transcript. You have to feel it. *[B-ROLL: clips of creators having "the moment" — pauses, eye contact, voice cracks]*

[APPROACH — 1:10-1:50] *To camera, confident.* So we built a pipeline that does. Audio energy peaks. Face presence. Hook strength. Pacing. Six signals, weighed by a model trained on what actually goes viral. The result isn't auto-clips. The result is taste-selected clips — the kind a good editor would pick, in three percent of the time. *[B-ROLL: RelatiV dashboard — six stage lights]*

[CTA — 1:50-2:00] *Direct.* Try it on your own video. Link in bio. We'll show you what your best moments actually look like.
